Lessons Learned

I enjoyed this class. For context, my degree is in Computer Science and Engineering and when I graduated the classes were grounded in C, C++, Pascal, and Ada. I've also done a lot of Visual Basic work in Excel and Word supporting various homegrown office automation projects. After graduation, I flew big planes in the US Air Force for 25 years before retiring. I now work at Boeing supporting Safety Data Analytics. It was great to get back to my coding roots and learn how Python works.

I found the course well laid out and straight forward. The notes and associated videos were clear and articulated the content well. I appreciated the asynchronous nature of the course as most of my course consumption and work occurred on Saturday/Sunday.

The use of PyCharm and GIT was interesting and super helpful as the last time I was programing from scratch it was on a unix machine using command lines with a dot matrix printer.

The built-in Python test package was also super helpful to learn about.

The "hardest" part of the course was training my fingers to type Python syntax; ie the use of lower case for variable names, adding ":" at the end of statements, etc.
